

CHECKLIST

In Commands.java – ExecuteCommand method – case SetColor, if we give an erroneous command like SetColor SC1 0XFFGFG 120 (both of the parameters are invalid, program doesn't print an error since it doesn't call either setColorCode and setBrightness methods.

In setSwitchTime, if the given switch time equals the currenttime, In ZReport, program puts it in the wrong place. Fixing it would need a brand new sorting algorithm and i don't have neither time nor energy to do it since i didn't have much time left when this case was evaluated in Piazza.

Except that, program matches the given I/O's (except 10 obviously) perfectly.

PS : In report, there is no index because parts have been seperated with headlines and contents are easy to find without an index since it is a short report.
